

Dear Subscribers,

After further consultation with the CDPHE, revisions have been made to our Backflow Prevention and Cross-Connection Control Program. It has been determined that if there is a connection to a raw water well, a Double-Check valve assembly is not adequate. Only a Reduced Pressure Zone (RPZ) backflow assembly or an Air Gap are acceptable devices or methods. Any well connection to a La Plata West Water Authority service must implement a testable RPZ device or an Air Gap method. Please see the revised BPPCCP on the website.

Sincerely,

La Plata West Water Authority
